weinor PergoTex II/LED – weather protection and outdoor feeling

An open air feeling meets wind and weather protection – with the flexible pergola awning PergoTex II. When it is open, it offers an open air feeling like being in a convertible and an unobstructed view to the starlit sky in the evening or at night. When it is closed, it protects against rain and provides sun and UV protection. Thus, you can use your patio in two ways. The elegant, high-quality self-supporting construction has been designed based on the proven weinor technology and it can easily withstand even high wind loads. The PVC awning material has a very high tensile strength, can be extended and retracted by means of a drive and, on request, is also available as a translucent, light-transmitting version – for a magic atmosphere on your patio.

PergoTex II highlights

**Convertible folding system
in 2 versions:**

- PergoTex II
- PergoTex II Basic

New aluminium safety shield

**Integrated LED
spotlights**

**Multi functional
wall sealing profile**

**Strong and sturdy
drive system**

47 frame colours
and 9 trend colours

Noise reduced water drainage

Controlled rainwater collection
and drainage

Straightforward, functional
design – posts with integrated,
easily accessible water drainage

Modular system

Variable water outlet

Product benefits in detail

The robust pergola Awning PergoTex II provides excellent weather protection in strong winds and heavy rain. To give the perfect "convertible" feel, it can also be opened completely. Here are the product benefits at a glance.

Convertible folding system – rain-proof, wind-resistant, retractable

- waterproof: light-proof or light-transmitting PVC fabric with high tensile strength
- pitch from 0° to 25° possible
- excellent water drainage from a pitch of 8° (no risk of water pooling)
- elegant design without screws in directly visible areas
- robust: suitable for wind loads up to Force 6 on the Beaufort scale (approx. 45 km/h)
- easy installation: only a few tools required, with pre-assembled adhesive seals
- easy sealing of wall profile (similar to Terrazza)

Rain gutter and posts – controlled rain drainage

Controlled water drainage – easy run off from the fabric safety shield through the side channels into the front gutter. Reduced fabric soiling.

- two-part posts:
 - cables for add-on products can be installed in the posts
 - water drain pipe can be easily accessed for servicing
- lateral small gutter along the side channel with separate groove for cable routing

Sturdy drive system – smooth operation

The proven pull system with heavy-duty and durable lasting components ensures infinitely, smooth extending and retracting.

- highly resistant toothed belt with ball bearings
- especially quiet-running rollers
- almost all visible covers are made of aluminium cast in the unit's colour

Wall sealing profile – easy access for adjustment

The wall mounted sealing profile is used to attach the side channels, rain protection shield and electronics. This makes installation and adjustment considerably easier. Receivers and power packs are easily accessed for future servicing, and LED components are also hidden. When the LED option is ordered the transformer/receiver bar (window strip) is supplied to attach the LED components.

In the case of the order option "without LED", the wall bracket is equipped with the mounting plate, but is delivered without the transformer/receiver bar. The order option "LED" additionally includes the transformer/receiver bar (window strip) to attach the LED components.

Variable water outlet

The square shapes of the posts ensure easy measuring and fitting of the glazing elements.

The two-part post design makes it possible to individually adapt the height of the water outlet during the assembly on site.

New high-quality aluminium safety shield with separate guttering

- very robust aluminium fabric safety shield designed as a chamber profile (noise-reducing during rain)
- optionally, the fabric safety shield can also be strengthened for higher snow loads
- rainwater runs off via the front gutter to the right and left into the lateral gutters along the side channels in a controlled manner
- easy to clean (smooth surface)
- reduced soiling of the fabric due to the guttering on the aluminium safety shield

HighPower LED spotlights – for an amazingly beautiful atmosphere

On request, dimmable HighPower LED-single spotlights can be integrated into the transoms.

- invisible cable routing in the fabric seams
- LED spotlights dimmable with BiConnect radio control
- 30,000 LED light hours with lowest energy consumption

(85% electricity saving compared to halogen technology)

- fixed spacing:
 - 500 mm between the LED spotlights on the transoms
 - a maximum of 12 LED spotlights per transom
 - a maximum of 4 staves with LED

Modular system – even more convenience and better weather protection

Easy to add and retrofit elements in the PergoTex II system:

- all-glass glazing elements
- vertical awnings
- the dimensions and shape of the guttering and the posts have been designed in such a way that

glazing elements (GE) can be mounted without additional profiles

- the whole unit is completed by smart wiring concepts tailored to the products

Preparation for mains connection (3 order options)

For all options, the wiring for the power supply is integrated into the components so that it is weather-proof, concealed and visually appealing.

- preparations for mains connection
 - for the installation of the VertiTex vertical sun protection on the guttering (front right/left)
 - for the installation of the lateral VertiTex
 - in the guttering for optional electricity consumers

- standard
- optional
- unavailable

Load	The PergoTex II has been tested in the maximum dimensions up to wind strength 6 on the Beaufort scale (= wind resistance class 3) and withstands this load.	

For the PergoTex II type pergola awning, the risk assessment was carried out in accordance with DIN EN 12100:2009. Please note that it may be necessary to have a special risk assessment carried out with respect to special conditions for use and locations, for example kindergartens or facilities for the disabled.

For comprehensive documentation and choice of patterns, see separate collection.

The weinor Pergona collection

The robust and waterproof PVC fabrics are available in 2 versions – either as **Pergona classic** or, subject to a surcharge, as **Pergona translucent**.

The special feature of the **Pergona translucent** is its high light transmission of up to 21%. The fabric

allows natural light through and provides optimal protection against rain and UV rays.

With its light transmission of up to 11%, the **Pergona classic** is ideally suitable for shading purposes. Dirty marks cannot be seen from underneath either.

weinor Pergona classic	weinor Pergona translucent

Wide range of frame colours – abundance of choices

weinor coats all of its products in its own workshop. This ensures that they have the best-possible colour tonality and identical gloss levels.

- 47 standard RAL frame colours, silk gloss (gloss level $70 \pm 5\%$ when measured at a 60° angle)
- 9 scratchproof, resistant trend colours with a textured look
- over 150 special RAL colours

weinor is an eco-friendly company. To ensure compliance with high environmental standards, manufacturing processes and materials undergo regular testing by experts.

As a result of the ban on the use of heavy metals in powder coatings, paint manufacturers can no longer guarantee colour stability despite making every effort to do so. It therefore cannot be excluded that colours in general, and Fire Red (RAL 3000) in particular, may fade with time. For technical reasons, the colours may appear significantly different when printed.

Integrated HighPower LED spotlights

30,000 hours of lighting with 85% lower energy consumption

Select LED components for top weinor quality:

- integrated into the transoms
- atmospheric light thanks to special glass lenses
- highly energy-efficient
- operating life of 30,000 hours
- infinitely dimmable when used with BiConnect radio control
- easy to service: simple replacement of individual LED lights
- a defined number of LED spotlights per transom
- spacing of the spotlights 500 mm
- a maximum of 12 LED spotlights per transom
- a maximum of 4 staves with LED spotlights

	Number of 45 x 60 mm transoms with LED									
	0	1	1	1	2	2	3	3	4	4

Options

- Changing of the position of the transoms with LED (without extra charge).
- Supplementing/ordering of additional transoms (45 x 60 mm) with/without integrated LED spotlights (extra charge).

Prerequisites

- Between the transoms with integrated LED spotlights, a transom (45 x 60 mm) without LED spotlights must be installed.
- A maximum of 4 transoms with LED spotlights per unit possible.
- Between the first transom with integrated LED spotlights and the transom (80 x 60 mm) on the wall, 0 or 1 or 2 transoms (45 x 60 mm) without integrated LED spotlights must be installed.
- Lighting in the transom (80 x 60 mm) on the wall and in the transom (80 x 60 mm) on the projection profile is not possible.
- Any number of transoms without LED possible between the last transom with LED and the transom (80 x 60 mm) on the guttering.

Possible choice and combination of the 45 x 60 mm transoms with LED (using the example of a PergoTex II with a projection of 241 – 305 cm)

- One 45 x 60 mm transom with LED centrally positioned ① (PergoTex II option LED standard configuration)

Further options

- Existing 45 x 60 mm transom with LED ① (position changed)
- Existing transom 45 x 60 mm supplemented with LED ②

- Existing 45 x 60 mm transom with LED ① (position changed)
- Existing transom 45 x 60 mm supplemented with LED ②
- Additional 45 x 60 mm transom (without LED) ③

- Existing 45 x 60 mm transom with LED ① (position changed)
- Existing transom 45 x 60 mm supplemented with LED ②
- Additional 45 x 60 mm transom (without LED) ③
- Additional transom 45 x 60 mm ④ (with LED)

PergoTex II with separate LED light bar

On request, the PergoTex II can also be supplemented with a separate light bar. This light bar is mounted to the wall or to the guttering. The spacing of the spotlights of the separate light bar is 550 mm and thus deviates from the spacing of the integrated LED spotlights.

From a width of more than 6,501 cm, two separate LED light bars are required.

Lowered LED light bar
Benefit: lighting even if the unit is retracted

LED light bar on the guttering
Note: The LED light bar on the guttering is ideally installed in combination with the weinor w50-c fixed element

Width in mm	Number of LED spotlights
1,500 – 1,649	2
1,650 – 2,199	3
2,200 – 2,749	4
2,750 – 3,299	5
3,300 – 3,849	6

Width in mm	Number of LED spotlights
3,850 – 4,399	7
4,400 – 4,949	8
4,950 – 5,499	9
5,500 – 6,039	10
6,040 – 6,500	11

BiConnect – operating convenience to enjoy

The new BiConnect radio control transmits bidirectional signals and is very reliable thanks to its ultra-modern routing technology.

In this case, the BiEasy hand transmitter sends a radio signal to an active receiver within its range. The signal is then forwarded from one receiver to the next until it reaches the target receiver – and all this occurs in a second (see graphic below).

Benefits for the user:

- secure radio signal through routing technology – even through facades with metal cladding or thick wall insulation
- direct feedback through control function on hand transmitter
- virtually no electronic emissions – significantly fewer than with conventional radio technology
- protected radio frequency, no disruptions from telephones or WiFi

How routing technology works*

This is how the signal is forwarded (routed) from one remote receiver to the next – any obstacles are circumvented.

* Very simplified illustration

↔ = Routing signal and feedback signal

Product	Equipment	Connection	Remote receiver	Function	Hand transmitter
PergoTex II	drive		BiRec MA	retracting/extending	BiEasy 1M/1MW-3V BiEasy 1M/5M/15M

	drive + LED lighting + heating system Tempura (option)	separate	BiRec MLED; BiRec HD	retracting/extending switching on/off dimming	BiEasy 5M/15M/App

PergoTex II configuration

Product	BiConnect
PergoTex II drive	remote receiver installed in wall sealing profile
LED lighting	dimnable, combined remote receiver for main drive and LED with integrated power supply pack installed in the wall sealing profile
Tempura heating	• dimmable, additional receiver required • installation of the receiver in the design bar provided for this purpose

Note:

Requirement for PergoTex II with radio control: sensors require at least a BiEasy 1M, 5M or 15M. The wall bracket is designed in such a way that the BiConnect remote receiver can be positioned invisibly behind a clamp bracket. Nevertheless, the BiConnect components can be easily accessed for servicing at all times.

Installation location for remote receiver, power supply pack and further electrical components

The BiConnect remote receiver ① is installed in the wall sealing profile ② and is covered by the PergoTex II fabric. However, the remote receiver can still be accessed easily, since the wall connection fabric can be easily removed from the wall bracket for servicing.

Tempura heating	• not dimmable • switch and wiring on site

Cable connection concept for three PergoTex II order options

Whether the VertiTex sun protection is installed on the guttering or on the sides or whether even connections for additional electricity components are provided: For all options, the cabling

is integrated into the components in a weather-proof and concealed way and has been prepared optimally in the factory. This ensures a visually appealing and secure installation.

I Preparations for the mains connection for the installation of the VertiTex vertical sun protection on the guttering (front right/ front left)

The power cable ① of the VertiTex ⑥ is routed through the guttering to one of the channels. For the cable bushing ⑭, a hole is drilled into the guttering on site and a cable sleeve ⑦ is inserted. Depending on the order option or the drive side of the VertiTex, the power cable of the VertiTex is routed either in the left or in the right, and in exceptional cases also in the centre, side channel ⑤ to the wall sealing profile and to the distributor box ⑨. For the outer side channels, a VertiTex cable can be fitted; for the centre side channel, it is also possible to fit two cables.

Factory-made assembly preparation:

- drilled hole and cable sleeve in the guttering ⑩
- cable tie ③ (fixing the cable in place, end cap)
- clips with cable sleeve
- 20 x 20 x 4 angle bracket with clip (bolting, end cap front)
- wedge seal (fixing the cable in place)
- distributor box with attachment ⑨

II Preparations for the mains connection for the installation of the lateral VertiTex

The cable of the VertiTex ⑮ is routed in the wall-side rectangular profile ⑧ through a drilled hole and a cable sleeve ⑦ in the wall sealing profile ⑫ to the distributor box ⑨. In the rectangular profile, there is not a drilled hole ⑪ yet for the VertiTex

power supply cable bushing. Thus, it is possible to fasten the locking bar and VertiTex in a flexible manner without any annoying visible, unused drilled holes.

III Preparations for the mains connection of optional electricity consumers on the guttering

The power ② for optional electric components (such as an LED light bar) is supplied on site via the E-Box ④ screwed to the top groove in the guttering. The cable running to one of the side channels is mounted to the guttering ⑬ on site using clips. The cable has already been routed in the side channel and the end cap front in the factory and leads to the wall bracket.

Tempura heating system

Tempura Universal heating system with high performance (option)

The energy-efficient Tempura infrared heating system has an impressive heating capacity of over 1,500 watts in a tiny housing.

- instant heat: no warm-up time
- turn as required for targeted warmth
- operate and dim using BiConnect radio control
- splash protection
- comes in 47 standard frame colours plus 9 scratch-proof, resistant trend colours with a smart, textured look
- optional: 150 special RAL colours
- universal bracket makes it easy to retrofit
- TÜV tested

Projection of the PergoTex II

(*Delta: dimension 3a minus dimension 3b = difference between installation height and clearance height)

The pitch of the projection 1 can be up to 25°. In contrast to other pergola awnings, the PergoTex II can also be mounted without a roof pitch (0°) (can then only be used as sun protection). Ideal water drainage

without a risk of water trapping is provided from an angle of inclination of 8°. The maximum projection is up to 6,500 mm.

The projection is the basis for determining the costs for a PergoTex II unit. Using the following table (next page), the projection 1 of the PergoTex II is determined on the basis of a given horizontal patio depth 4.

The projection is calculated on the basis of

- the **angle of inclination** 2,
- the **delta*** 3,
- the **patio depth** 4.

The maximum clearance height 3 is 2,400 mm. If this clearance height of 2,400 mm is exceeded optionally, the stability must be proven on site.

The dimension 5 is the spacing between the house wall and the side channel (specified with 88 mm in the example above, based on an angle of inclination of 10°). The spacing depends on the angle of inclination. If necessary, the dimension 5 is

used to determine the overall dimensions of the awning (wall bracket to front edge of guttering).

Angle of inclination	Spacing between house wall and side channel (dimension 5)
8°	86
10°	88
15°	92
20°	97
25°	103

	Patio depth (in mm)								

Table 2: projection depth at an angle of inclination of 8°/10°/15°/20° and 25°.

Example 2: At an angle of inclination of **10°** and a patio depth of **3,000 mm**, the actual projection is **3,161 mm**.

Lateral covers – for each projection

The elegant cover plates ⑨ and cover caps ⑩ cover the mounting technology, protect it against dirt and produce a harmonious side view.

Fabric folding height

The fabric of the PergoTex II consists of a robust PVC material and is opened with a folding mechanism (folding awning).

The fabric folding height ④ and the depth of the fabric safety shield ⑤ depend on the length of the projection/patio depth ① and the number

of staves ⑥. Depending on structural requirements or individual customer requests, the number of staves can be increased to reduced the fabric folding height. The additional transoms may increase the depth of the fabric safety shield ⑤.

Fabric end

PergoTex II

(angle of inclination from 0° to 18°)

For a PergoTex II at an angle of inclination from 0° to 18°, the fabric end ⑦ is made by welting the fabric in the wall sealing profile ⑧.

Fabric end from 0° to 18°
(not for PergoTex II Basic version)

PergoTex II

(angle of inclination > 18° to 25°)

From an angle of inclination > 18° to 25°, the fabric is mounted to the wall sealing profile using a velcro fastener ⑨ so that it is flush with the house wall.

Fabric end > 18° to 25°
(for PergoTex II Basic from 0° to 25°)

PergoTex II Basic

(angle of inclination from 0° to 25°)

The fabric of the PergoTex II Basic (angle of inclination from 0° to 25°) is generally mounted to the wall gap sealing profile using a velcro fastener ⑨, since the angle of inclination is not known.

Additional side channel

From a width of more than 4,501 mm, a third side channel ① is required.

PergoTex II with third side channel

Quiet protection – the aluminium fabric safety shield

The new aluminium fabric safety shield ① has been designed as a hollow-chamber profile and has a noise-reducing effect when it rains. Rain water runs off the aluminium

fabric safety shield ① sideways to the right and left in a controlled manner ②.

Controlled rain drainage

When fully extended, the front transom ③ is located directly above the guttering ④. A transparent plastic lip ⑤ drains the dripping or rain water directly into the guttering ④ and then into the water drains of the posts.

Aluminium fabric safety shield – use of support profiles

From a safety shield depth of more than 720 mm and from a width of more than 4,000 mm, the use of aluminium support profiles ② (order option/extra charge) is required. The support profiles are screwed to the safety shield retention profile using clamping sliders. Support profiles make it easier to install long safety shield profiles, since they can be placed on the already pre-assembled support profiles.

Aluminium fabric safety shield – use of reinforcements for higher snow loads

When providing reinforcement by using the 100 x 40 mm safety shield reinforcement profiles, the support profiles do not have to be used. The reinforcements are mounted in the factory in accordance with the specified snow load as well as width and projection.

Aluminium fabric safety shield profiles and distribution of staves

Projection	Distribution of transoms			Distribution of the safety shield		Fabric safety shield depth (values depend on the pitch; the values below refer to a pitch of 10°)

Supporting all-rounders – the posts of the PergoTex II

The stable and attractive posts of the PergoTex II are part of the smart water drainage construction and drain the rain water in a controlled manner.

Integrated water drainage

The downpipe ① is invisibly integrated into one of the posts ②. When using post plates (in this figure, the example of large post plates is used), ③ the water drainage can be discharged directly downwards ④ or through a water outlet (on the post corner ⑤ or sideways/to the front ⑥). The height of the water outlet is variable ⑦ and can be easily adjusted on site by means of the two-part post design ⑧ ⑨.

Due to the two-part post design ⑧ and ⑨, the inside of the post can also be accessed easily, for example for cable routing or servicing work on the water drain pipe.

Positioning of the posts

The standard position of the "outside posts" is the position in which the side channels and the guttering are aligned flush on the sides.

(not flush in the case of centre/wall posts)

Indentation of posts

Depending on the structural requirements or customer requests, the posts can be indented up to a maximum of 30% of the total awning width.

Indenting a post is only possible on one side. The same applies to the symmetrical or asymmetrical indentation of the posts on both sides along the guttering.

Post fixation

Post fixation on concrete floor slabs ①

The standard configuration is the installation of the PergoTex II with post plates on a given (or existing) concrete floor.

Post fixation on concrete floor slabs

Bucket foundation ②

With the bucket foundation, the posts are set in concrete on artificial substrates reliably and flexibly at the same time. Only after the post has been installed, the bucket foundation is completed with concrete or mortar, making the alignment of the posts easier.

Bucket foundation
Min. dimensions 700 (w) x 800 (h) x 700 (d) mm

Deep-seated foundation ③

The easy and flexible screw attachment on a 700 (w) x 800 (h) x 700 (d) mm screw foundation is carried out like the standard fixation (item 1).

Deep-seated foundation
Min. dimensions 700 (w) x 800 (h) x 700 (d) mm

Screw foundation ④

Fixation in no time – on natural ground, screw foundations are an alternative to conventional foundations.

Benefits:

- cost and time savings
- no concrete curing times
- no excavation necessary (no impairment of the surrounding area)

Krinner screw foundation

Foundation plan

PergoTex II post plates

The weinor PergoTex II post plates connect the awning permanently to all substrates and complete the flexible, stabile framework assembly. Post plates are distinguished as follows: "outside post plates" ① (for the outer posts of the awning) and "centre/wall post plates" ② (post plates for centre or outer posts which are flush next to a wall). Small post plates ③ (order option) are suitable for small folding awnings or for installation in showrooms.

Post plates for "outside posts"

- "large post plate for outside posts"
 - water drainage bushing
 - can be turned by 180°
- "small post plate for outside posts" (optional)
 - flush with posts
 - optimised for small awnings

Large post plates (outside)

Small post plates (outside)

Post plates for "centre/wall posts"

- large centre/wall post plate
 - fixation of centre posts
 - fixation of an outer post next to a wall
 - water drainage bushing
 - can be turned by 180°
- Small post plate for outside posts
 - optimised for small awnings

Large post plates (centre and wall)

Small post plates (centre and wall)

Turning of post plates

If the post plates must be flush with the posts on the outside, since this is required, for example, by adjacent objects (e.g. walls or plants), the post plates can be turned by 180° ④.

Post plates oriented to the outside (standard)

Post plates turned to the inside

Post position and post distance

Standard; "outside post" ④

Standard with "centre/wall" option ⑤;
is only delivered on customer request;
may be necessary for VertiTex option

"Centre/wall post"
(may be necessary for VertiTex option)

Wall left and right; "centre/wall post" ⑤

Wall left; "centre/wall post" left ⑤ and
"outside post" right ④

Note

If the PergoTex II is installed between two lateral walls, we recommend indenting the lateral spacing of 100 mm (instead of 5 mm) on the drive side to make it easier to access the drive for servicing.

Key:

PP - Position of posts
AP - Spacing of posts
- Guttering ⑥

Aluminium plug-in unit profile

With the optional 300 mm aluminium support profile ② available for order (picture on the left), the stability of the post fixation is increased.

As a special design, an extra-long aluminium plug-in unit profile ③ (production according to the post length*) can also be delivered to stabilise extra-long posts ① (picture on the right). From a post length of more than 2,400 mm, weinor recommends inserting the aluminium plug-in unit profile or mounting additional posts. If the post height of 2,400 mm is exceeded, the stability must be proven on site.

Cover cap for post plate

Cover cap for large post plate (outside post)

Cover cap for large post plate (centre and wall), post shown with water drainage)

The cover caps ① of the post plates are elegant end elements of the awning so that screws are no longer visible. The cover caps are put flush over the post plates.

Cover cap for large post plate (outside post); if necessary, it can be turned by 180° together with the post plates

Cover cap for large post plate (centre and wall); if necessary, it can be turned by 180° together with the post plates

Glazing elements and combinations for the PergoTex II

The PergoTex II pergola awning can be supplemented with weinor glazing elements (GE). The table shows the options and possible combinations of weinor sun protection

systems and glass elements* with the LITE side element (the triangular trapezoidal area below the side channel).

* Further information (special permission if necessary) on our flexible all-glass elements can be found in the separate weinor glazing element product brochure.

		Maximum wind load in wind strength on the Beaufort scale (wind speed)
 VertiTex with rail guide	●	5 (approx. 35 km/h) Must be opened when there is strong wind to reduce the lateral wind load
 VertiTex with rope guide	●	5 (approx. 35 km/h) Must be opened when there is strong wind to reduce the lateral wind load
 w17-c easy-glide sliding wall	●	6 (approx. 45 km/h) Must be opened when there is strong wind to reduce the lateral wind load
 w50-c fixed element	○	Only at a low pergola awning depth or in a position sheltered from the wind
 Super Lite w50-c fixed element	○	Only at a low pergola awning depth or in a position sheltered from the wind

○ on request
● combinable

Fixed glazing – the weinor w50-c LITE side element

Suitable for the PergoTex II, weinor offers the fixed glazing w50-c LITE ① side element. This side element is suitable for the trapezoidal area up to an angle of 25°.

- highly transparent
- two-part retaining section
- no screws in visible areas
- attractively priced
- fixed glazing
- can be combined with w17-c easy-glide sliding wall
- can be combined with VertiTex rail or rope guide
- can be combined with w50-c fixed element on request

Dimensioning of the w50-c LITE side element

At a low height of the w50-c LITE side element due to a low angle of inclination of the side channels, the fabric of the PergoTex II can rest on the locking bar of the trapezium during the retracting and extending process as well as in the retracted position ①. In the long term, signs of abrasion may occur. By ordering additional transoms, the fabric folding height can be reduced and thus the possibility of the fabric resting on the locking bar of the trapezium minimised ②.

Depending on the projection, up to 4 transoms (2 transoms in the case of the LED option) are possible as supplements.

Large pitch of the side channel

The fabric does not rest on the locking bar of the trapezium.

Low pitch of the side channel

The fabric rests on the locking bar of the trapezium (signs of abrasion on the fabric are possible).

Low pitch of the side channel

With additional transoms (fabric folds), the fabric does not rest on the locking bar of the trapezium in the retracted position, since the fabric folding height is reduced by additional transoms.

Side element with wind support bracket, steel reinforcement in the locking bar and additional post

The size, surface and weight of the w50-c LITE ① side element result from the pitch of the projection ⑤ and the depth of the PergoTex II ⑥. Depending on the dimensioning of the side element, the additional use of

- a steel girder* ⑦ in the locking bar ②,
 - an additional post ③,
 - or a wind support bracket ④
- is required to prevent the locking bar** from being overloaded or to counteract an increased lateral wind load.

* Optionally integrated steel girder in the locking bar (prepared in the factory)

** w50-c LITE side element rests on the locking bar

VertiTex – weinor vertical sun protection

The weinor VertiTex vertical sun protection offers perfect visual and anti-dazzle protection.

With its small cassette ①, the VertiTex adapts inconspicuously to the PergoTex II design. The fabric of the polyester, acrylic, Soltis® or Perluca collection provides protection against sun and wind. In addition, the Soltis® and Perluca collections

which are translucent from dark to light conditions make it possible to see the environment from the inside.

VertiTex details:

- suitable for large areas (6,000 x 2,400 mm)
- VertiTex to be installed on the guttering for the front side ②
- VertiTex on the sides ③
- rope guide or guide rails

Note:

The installation of the VertiTex on the front side of a PergoTex II is easily possible on the guttering and the posts without further additional elements. Lateral VertiTex sun protection systems require a wall-mounted rectangular pipe and the horizontal locking bar or the LITE side element. For further information see the separate VertiTex product brochure.

Position of the VertiTex on the guttering and on the posts of the PergoTex II

PergoTex II with centre post and front position of the GE (the guttering is sketchily shown in orange)

w17-c easy-glide sliding wall

Alongside an all-round view, weinor w17-c all-glass easy-glide sliding walls provide reliable protection against wind and driving rain.

- opens sideways
- actuator for easy closing
- guide profiles with several tracks (2 to 5 depending on the design)
- standing construction
- transparent gap seals between the glass of lockplate systems
- pane packages which can be slid open to the left and right up to 6,600 mm (optional as lockplate design up to 10,000 mm; depending on the number of tracks)
- maximum height of 2,600 mm
- highly resistant to driving rain and windproof

From a wind strength of 6, the glazing elements must be opened completely and the PergoTex II retracted completely so that the wind will find no opportunity to attack. Larger dimensions available on request.

w17-c all-glass easy-glide sliding walls with sliding option

w17-c all-glass easy-glide sliding walls with lockplate option

Multi-section units

The maximum size of a PergoTex II pergola awning with two posts is 7,000 x 6,500 mm. Wider systems can be extended easily to become a multi-section unit by placing 1-unit systems next to each other. The 1-unit systems installed next to each other have a separate motor drive

and can thus be retracted and extended separately. Deliberately dispensing with a continuous fabric facilitates the installation and the units are easy to maintain in the event of servicing or damage.

Example of a multi-section unit with different dimensioning (on the left with additional side channel). The maximum unit width with two side channels is 4,500 mm.

Connecting PergoTex II units with the coupling panel

Using the coupling panel ①, the side channels of two units are connected and rain water can be prevented from entering between the units.

Coupling panel ① on two side channels ②

Note: guttering coupling point always without water drainage

Side channels with coupling panel (profile view)

Multi-section units with offset

On request, various offset versions can be produced (e.g. wall offset).

Key

x = lateral spacing 5 mm or 100 mm;
weinor recommends installing the drive side of the awning with a spacing of 100 mm to the wall.

Multi-section unit with offset (top view)

Multi-section unit with offset (profile view)

Gap covering in the wall offset with lateral wall bracket

The lateral wall bracket ① covers the gap between the wall and the unit in the wall offset area and protects against penetrating rain water. The lateral wall bracket ① can be adapted to the structural conditions and cut to the required length.

"Large" lateral wall bracket ②, for unit 2 with drive on the left (lateral spacing of 100 mm)

"Small" wall bracket ③, for unit 2 with drive on the right (lateral spacing of 5 mm)

Correction of different stave positions in the case of wall offset

Due to the different depth, the transoms have a different spacing between each other ④. The transoms of the 1-unit systems have different positions when they are extracted.

An adjustment of the stave positions is possible subject to a surcharge ⑤.

Different stave positions in the case of wall offset without adjustment ④

Stave positions in the case of wall offset with adjustment ⑤

Installation of the PergoTex II on the wall using the weinor wall sealing profile

The PergoTex II is installed to a wall* using the wall sealing profile. On the one hand, the wall sealing profile is used for the comfortable, visually appealing and stable installation of the PergoTex II.

On the other hand, the wall sealing profile is the installation location for the remote receiver, the power supply pack (LED option) and other electric components which are installed there so that they are invisible, but can be still accessed easily for servicing.

* For the installation of the PergoTex II on a ceiling, laterally on a wall or in a niche, the wall sealing profile is mounted using angle brackets; see the following chapter: "Angle brackets".

Installation of the PergoTex II on the wall using the wall sealing profile

weinor PergoTex II angle brackets

Thanks to the weinor angle brackets, the PergoTex II can be installed easily and in a stable and flexible manner for any structural condition.

weinor PergoTex II guttering angle bracket

Installation of the safety shield on the safety shield profile from below

Using the weinor 40 x 40 x 5 x 60 mm angle bracket, it is possible to screw the safety shield to the safety shield profiles from below if there is no space to install it from above (e.g. under a balcony).

Rafter mounting

On request, rafter mounting is possible (optional). The wall sealing profile **1** is installed on rafters **2** on site using weinor rafter brackets **3** and mounting plates **4**. In the case of the optional rafter mounting, the

wall sealing profile is delivered without mounting holes pre-drilled in the factory **3***. Mounting holes in the wall sealing profile must be drilled on site according to the rafter spacing.

* No annoying visible mounting holes which are not used The optional rafter mounting must be specified when placing the order to ensure that the wall sealing profile is delivered without mounting holes **5**.

PergoTex II Basic

PergoTex II Basic (without posts and guttering)

The weinor PergoTex II Basic is delivered without posts, fabric safety shield and guttering (basic version). It is always the suitable option in particular if the pergola awning is to be placed and installed on existing masonry or on existing posts. Due to its design, it cannot be combined with the VertiTex and the glazing elements, easy-glide sliding wall, LITE side element or fixed glazing.

PergoTex II Basic – projection and pitch

Like the PergoTex II, the PergoTex II Basic can also be aligned with an angle of inclination from 0° to 25°. The projection ⑤ of the PergoTex II Basic is the basis for determining the costs. The basis is a given horizontal patio depth ③, the height of the wall bracket, the angle of inclination or the height of the bottom edge at the front. The projection ⑤ and dimensions ④ are determined in a similar way to the PergoTex II (as described on page 22).

The fabric of the PergoTex II Basic ① is mounted to the wall sealing profile ② using a velcro fastener irrespective of the angle of inclination.
